

Website UI & Performance Optimization Report

Website: Gulf Kerala Vacancies **Status:** Theme Code Fully Optimized

✓ 1. Issues Solved (Completed)

Performance & Speed (Core Web Vitals)

- **LCP (Largest Contentful Paint) Fixed:** The main header logo and the first post image on the homepage were previously loading too slowly. We removed the "lazy load" delay and added "high priority" fetching (**eager** loading) to these specific elements. They now load instantly, drastically improving the site's perceived speed.
- **Smart Lazy Loading Implemented:** While the top images load instantly, all images below the fold are now strictly lazy-loaded to save data and speed up the initial page render.

Layout Stability (CLS - Cumulative Layout Shift)

- **Image Jumping Fixed:** Added a strict **16/9 aspect-ratio** and placeholder backgrounds to all post thumbnails. The browser now reserves the exact space for images before they even download, completely stopping the text from jumping up and down while scrolling.
- **Ad Container Stabilization:** Added **min-height** and **max-height** rules to advertisement slots. This prevents massive blank black gaps from collapsing and expanding unpredictably on mobile screens before the ads load.

User Interface (UI) Corrections

- **Long Title Overflow Fixed:** Long Malayalam job titles were previously breaking the grid layout. We implemented a strict 2-line limit (**-webkit-line-clamp**) with word-break rules. Titles now neatly cut off with an ellipsis (...) if they exceed two lines.
- **Mobile "Wall of Text" Fixed:** Post snippets (short descriptions) are now hidden on mobile devices. This makes the mobile homepage look much cleaner, modern, and easier to scroll through without reading a wall of text.
- **Code Cleanup:** Fixed broken XML tags and removed duplicate CSS rules to ensure the theme runs without errors.
